

# Propagation Dome Cleaning

## Equipment

- Milwaukee 3ltr spray bottle with Isopropyl Alcohol
- Microfibre cloths (for drying and wiping)
- Plastic-safe detergent (non-abrasive)

## Notes

- Do NOT scrub dome with brush or abrasives — it will scratch and cloud the plastic.
- Do NOT use bleach or hydrogen peroxide on plastics or metal hinges — both are corrosive and reduce lifespan.
- Ensure Isopropyl container is sealed at all times to prevent evaporation.  
Always wipe surfaces down to fully dry — leaving moisture encourages mould growth.

## Procedure

- Action: Remove dome, tray, and inserts. Empty all plant matter and debris into rubbish
- Action: Wipe down with soft sponge and small amount of dish wash detergent and warm water, then rinse off.
- Action: Spray trays and domes with Isopropyl Alcohol. Let drain.
- Wait: Allow to air-dry 10 minutes, ensuring full evaporation.
- Finish: Reassemble clone box with dry hands and store with dome off until next use.
